The ordered list is usually used to display numbered list elements.

```
<ol>
    <li>First</li>
    <li>Second</li>
    <li>Third</li>
</ol>
```

The definition list it not as common but is used to hold definition data and term elements.

```
<dl>
    <dt>Unordered List</dt>
    <dd>An HTML element made up of list elements in no particular ord
    <dt>Ordered List</dt>
    <dd>An HTML element made up of list elements in order</dd>
    <dt>Definition List</dt>
    <dd>An HTML element with definition term and definition data eler
</dl>
```

Links

What is commonly referred to around the internet as a "link" is a clickable element that directs the browser to another page or area on the page. This is not to be confused with a link tag, which will be discussed in future sections.

To create a link using an html element we use what is called an anchor tag:
